

DURABLES

RFID / NFC protection

SAFETY FIRST

In recent years transmission technologies have developed and are largely established on the contact-free transmission of personal data via RFID (Radio frequency identification) or NFC (Near-field communication). Data is transmitted and stored to a transponder, which can be read using a reader. Protective products offer protection against unauthorised reading or manipulation.

The resonance circuit of the transponder is clearly shielded by the compound material, which reduces the reading range from a few centimetres to a few millimetres and distorting the frequency so much that no data transmission is possible.

Special benefits:

- > Perfect protection of data due to a shield core
- > Test at wavelengths from 13.56 MHz have proven that the RFID chips could not be read
- > Good flatness and high tear resistance
- > Universal printability
